## OpenStax Chapter 26 Equations - Optical Instruments & Vision

Angles in radians

$$\theta = s/r$$
 angle = arc length / radius = separation / distance away.

Lens power

$$P = 1/f$$
 (power in diopters, when  $f$  is in meters).

Cameras

$$f/D = \text{f-number}$$
, or lens aperture film exposure = exposure time / (f-number)<sup>2</sup>.  $\frac{1}{d_o} + \frac{1}{d_i} = \frac{1}{f}$  (lens equation)  $m = -d_i/d_o = h_i/h_o$  (linear magnification)

Vision correction

Far point 
$$FP = \infty$$
. (good vision) Near point  $= NP \le 25$  cm. (good vision) Nearsighted. Use lens to get  $FP = \infty$ . Farsighted. Use lens to get  $NP = 25$  cm.

Simple magnifier

$$\theta = \frac{h_o}{\text{NP}}$$
 (angular size at NP, via bare eye)  $\theta' = \frac{h_o}{d_o}$  (angular size at  $d_o$ , thru magnifier)  $M = \frac{\theta'}{\theta} = \frac{\text{NP}}{d_o}$  (ang. Mag. viewed at any  $d_o$ )  $M = \frac{\theta'}{\theta} = \frac{\text{NP}}{f}$  (ang. Mag. viewed at  $d_o = f$ )

Microscopes

$$\begin{split} \theta &= \frac{h_o}{\text{NP}} \quad \text{(angular size of object at NP, via bare eye)} \\ m_o &= \frac{h_i}{h_o} = \frac{-d_i}{d_o} \quad \text{(1$^{st}$ image, linear magnification of objective lens)} \\ M_e &= \frac{\theta'}{\theta} = \frac{\text{NP}}{d_o'} \quad \text{(angular magnification due to eyepiece lens)} \\ M &= \frac{\theta_{\text{micro}}}{\theta} = m_o M_e \quad \text{(net angular magnification compared to bare eye)} \end{split}$$

Telescopes

$$M = \frac{\theta'}{\theta} = -\frac{f_{\text{obj}}}{f_{\text{eye}}}$$
 (angular magnification compared to bare eye)
